

Abstract

In a razor including a shaving aid applicator, a reservoir is coupled to a razor body and defines an interior area adapted to retain a quantity of shaving aid therein. An actuator associated with the reservoir is movable between a non-dispensing and dispensing position to selectively cause an amount of shaving aid contained in said interior area to flow therefrom. At least one discharge opening is associated with the razor body to allow the shaving aid to flow therefrom onto a user's skin during a shaving operation.
